

A Target partitions

Shared One action for all targets

Family One action per family

Exact One action per target

Coarser pooling → finer target conditioning

B Oracle gain versus selection cost

Gaussian estimated-risk model

$$\bar{R}_n(\mathcal{P}) = R^*(\mathcal{P}) + E_n(\mathcal{P})$$

Oracle gain Selection-cost change

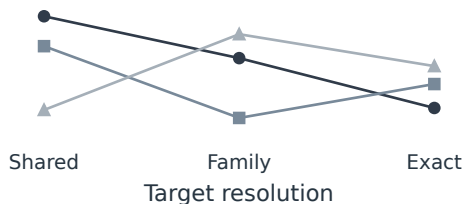

$$\Delta R^* > \Delta E_n$$

Refine when oracle gain exceeds the selection-cost change.

C Possible learned-risk profiles

SCHEMATIC — no empirical values

Expected learned risk
(schematic)

- Monotonic improvement
- Intermediate minimum
- ▲ Non-monotone ordering

D Nested biological-unit evaluation
